

ASX ANNOUNCEMENT 25 March 2025

Further Gold Ground Consolidated at Mangaroon (100%)

HIGHLIGHTS

- Dreadnought has further consolidated ground at Mangaroon by acquiring, subject to Settlement, M09/63, E09/2195 and L09/27 from an unrelated vendor (key terms shown later in this announcement).
- These tenements complement the existing tenure (Figure 2) and provide additional gold mineralisation with limited previous drilling but high prospectivity.
- Importantly, M09/63 is a mining lease containing the historical McCarthy Workings which complement our other 5 mining leases and has the potential to generate short term production ounces.
- The historical McCarthy Workings are located within sediments of the Edmund Group and have been described as saddle reefs and stockworks. There is no record of the amount of historical production. However, rock chips collected from the mullock heaps have confirmed gold mineralisation with significant results including:

MCRK010: 15.1 g/t Au MCRK007: 3.4 g/t Au

• Drilling is expected to commence this month at several targets on mining leases (Star of Mangaroon, Popeye, Pritchard's, Two Peaks and Lead Gold Mine). This program aims to identify and add ounces to production.

Dreadnought Resources Ltd ("Dreadnought") is pleased to announce it has, subject to Settlement, acquired tenements strategically located around the 100% owned Mangaroon Gold Project ("Mangaroon"), in the Gascoyne region of WA.

Dreadnought's Managing Director, Dean Tuck, commented: "Subject to Settlement, this acquisition has continued to expand our footprint over highly prospective gold corridors with historical gold occurrences including a sixth mining lease. The

acquisition of this position over the Edmund Group and major crustal scale structures is strongly in line with our near-term production ounces and discovery pillars of the gold strategy at Mangaroon.

Knowledge gained from exploring McCarthy Workings will have immediate benefit to understanding the potential of other regional analogues at Mangaroon.

We believe that the known high-grade gold occurrences, areas of historical production with limited to no drilling, and key lithostructural settings will deliver compelling targets for discovery and near-term production ounces."

Figure 1: Image of Dreadnought's Frank Murphy collecting a sample of the gossanous quartz veins at the McCarthy Workings.

ASX:DRE Dreadnought Resources Ltd | I

M09/63, E09/2195 and L09/27 (100%)

M09/63, E09/2195 and L09/27 immediately adjoin Mangaroon to the SE. The ground is highly prospective for gold and contains several areas with historical diggings including the McCarthy Workings where there was production but no records.

The tenements cover ~30km² of the Edmund Group near Cobra Station which is the location of the original Gascoyne gold field. The Edmund Group sediments and volcanic sills are edged between the crustal scale Lyons River and Edmund Faults, the area is also a terminating location of the Minnie Creek Fault.

The McCarthy Workings have been described as saddle reefs and stockworks within a tightly folded anticline within the Edmund Group Sediments and Narimbunna Dolerite. Rock chips from the mullock heaps returned significant results including:

MCRK010: 15.1 g/t Au MCRK007: 3.4 g/t Au

Mapping and sampling of the historical workings described that these workings were developed on near vertical axial plain veins with minor workings on saddle reefs. A handful of holes were drilled, but despite the observation that mineralisation was in vertical veins, holes were drilled vertically which are considered ineffective. A few angled holes

do not appear to have been drilled deep enough to test under any of the old workings. Further review and mapping of the historical work will be undertaken prior to drill program design.

The McCarthy Workings and the wider tenement package are viewed as under explored having been in control of prospectors with small scale operations for the past 30 years.

Mapping and surface sampling will occur in April 2025 and an RC drilling program is planned for June 2025.

Figure 2: Plan view image showing the location of the McCarthy Workings within M09/63, E09/2195 and L09/27 and the recently announced E09/2479 in relation to the wider Mangaroon Project and gold occurrences.

Details of the Transaction

Key Terms:

- Dreadnought to own 100% of M09/63, E09/2195 and L09/27 upon Settlement.
- Dreadnought to pay \$200,000 at Settlement.
- Vendor to receive fully paid ordinary shares, escrowed for 12 months, valued at \$200,000 based on a 5-day VWAP at Settlement.
- 1% net smelter royalty payable.
- Settlement conditions include: Regulatory approvals; the Royalty Deed: and the Parties assigning any Third Party Agreements.

ASX:DRE Dreadnought Resources Ltd 3

Snapshot – Mangaroon Gold (100%)

Mangaroon Gold is 100% Owned by Dreadnought

Mangaroon covers >5,000kms² with an initial focus on the gold system situated over the Mangaroon Shear Zone between the crustal scale Minga Bar and Edmund Faults with multiple phases of intrusions. Numerous historical workings along the Mangaroon Shear Zone have only seen limited, shallow drilling along ~200m of strike near the Star of Mangaroon mine. This area also contains the ~12km x 6km Bordah and ~50km long High Range prospects where limited previous exploration has identified outcropping gold and base metal mineralisation.

Self-Funded Explorer Strategy

Dreadnought's strategy is to transform into a self-funded explorer. This involves a high-grade open pit at the Star
of Mangaroon where funding, development, haulage & processing are outsourced to third parties. This is a
common model in WA given the robust gold price. Once successful, extend this model to Popeye, Two Peaks,
Lead, Pritchard Well, etc. In this way, there is reduced reliance on market funding and internal cashflows are
aimed at making life-changing discoveries.

Consolidation Provides for First Ever Modern Exploration

All historical workings and known gold occurrences relate to outcropping mineralisation. There has been minimal
historical and modern exploration due to fractured, small-scale ownership with Dreadnought now undertaking
modern exploration for the first time.

Significant, Step-change, Growth Potential

- Five historical mines developed on outcropping mineralisation and dozens of gold occurrences along highly prospective structural corridors.
- Dreadnought is deploying modern geochemical and geophysical techniques to explore for mineralisation under shallow cover. These techniques have already generated new prospects with stronger and larger signatures than the historical mines, including the region's largest high-grade producer at the Star of Mangaroon mine.
- Project-wide stream sediment sampling and geophysical surveys have identified additional camp scale prospects at Bordah and High Range.

Shallow, High-grade Gold

• The initial Resource at Star of Mangaroon contains shallow, high-grade gold as per Table 1 below:

Table 1: Resource (2g/t Au cut-off grade) - Numbers may not add up due to rounding.

Туре	Indicated				Inferred		Total			
1,750	Tonnes	Au (g/t)	Au (Oz)	Tonnes	Au (g/t)	Au (Oz)	Tonnes	Au (g/t)	Au (Oz)	
Transition	1,900	26.9	1,700	-	-	-	1,900	26.9	1,700	
Fresh	42,500	13.0	17,800	12,200	9.8	3,900	54,700	12.3	21,700	
Total	44,400	13.6	19,500	12,200	9.8	3,900	56,600	12.8	23,400	

Also, Popeye, located < I km from the Star of Mangaroon, contains significant shallow high-grade gold including:

POPRC001: 3m @ 22.8 g/t Au from I3m POPRC002: Im @ I.6 g/t Au, I5.5g/t Ag from IIm

Exceptional Metallurgical Recoveries

 The region is known for its free gold. Accordingly, metallurgical work at Star of Mangaroon produced exceptional recoveries from standard gravity and carbon in leach circuits averaging 96.7% combined recovery including an average 74.4% gravity recovery (ASX 14 Oct 2024).

ASX:DRE Dreadnought Resources Ltd 4

Cautionary Statement

This announcement and information, opinions or conclusions expressed in the course of this announcement contains forecasts and forward-looking information. Such forecasts, projections and information are not a guarantee of future performance, involve unknown risks and uncertainties. Actual results and developments will almost certainly differ materially from those expressed or implied. There are a number of risks, both specific to Dreadnought, and of a general nature which may affect the future operating and financial performance of Dreadnought, and the value of an investment in Dreadnought including and not limited to title risk, renewal risk, economic conditions, stock market fluctuations, commodity demand and price movements, timing of access to infrastructure, timing of environmental approvals, regulatory risks, operational risks, reliance on key personnel, reserve estimations, native title risks, cultural heritage risks, foreign currency fluctuations, and mining development, construction and commissioning risk.

Competent Person's Statement – Mineral Resources

The information in this announcement that relates to the Star of Mangaroon Mineral Resource is based on information compiled by Mr. Paul Payne, a Competent Person who is a Fellow of the Australasian Institute of Mining and Metallurgy. Mr. Payne is a full-time employee of Payne Geological Services Pty Ltd and is a shareholder of Dreadnought Resources Limited. Mr. Payne has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves'. Mr. Payne consents to the inclusion in the announcement of the matters based on his information in the form and context that the information appears.

Competent Person's Statement – Exploration Results

The information in this announcement that relates to geology, exploration results and planning, and exploration targets was compiled by Mr. Dean Tuck, who is a Member of the AIG, Managing Director, and shareholder of the Company. Mr. Tuck has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Tuck consents to the inclusion in the announcement of the matters based on the information in the form and context in which it appears.

The Company confirms that it is not aware of any further new information or data that materially affects the information included in the original market announcements by Dreadnought Resources Limited referenced in this report and in the case of Mineral Resources, Production Targets, forecast financial information and Ore Reserves, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. To the extent disclosed above, the Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

JORC Code, 2012 Edition - Table I Report Template Section I Sampling Techniques and Data (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
		Catalyst and Nina Rock Chips
Sampling techniques	 Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any 	Rock chips were collected by Nina Minerals (vendors), Catalyst and their contractors (previous explorers). Rock chips were submitted to ALS Laboratories in Perth for determination of gold by fire assay and ICP-MS finish (ALS Method Au-ICP21), 48 other elements by four acid digest and ICP-MS finish (ALS Method ME-MS61) and for ore grade tungsten analysis by lithium borate fusion and XRF finish (ALS Method ME-XRF12).
	measurement tools or systems used.	Dreadnought Rock Chips
	 Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as 	Rock Chips were collected by Dreadnought staff and submitted for analysis. Rock chips are random, subject to bias and often unrepresentative for the typical widths required for economic consideration. They are by nature difficult to duplicate with any acceptable form of precision or accuracy. Rock chips have been collected by Dreadnought to assist in
	where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	characterising different lithologies, alterations and expressions of mineralisation. In many instances, several rock chips were collected from a single location to assist with characterising and understanding the different lithologies, alterations and expressions of mineralisation present at the locality.
		Rock chips were submitted to ALS Laboratories in Perth for determination of gold by fire assay and ICP-MS finish (ALS Method Au-ICP22) and 48 other elements by four acid digest and ICP-MS finish (ALS Method ME-MS61).
		Soil Sampling
		Soil samples were collected by Dreadnought and contractor (OZEX Exploration Services) personnel on a 800x50m, 400x50m, 200x50m or 100x50m grid across the Project.
		Samples were collected by digging a 30x30x10cm pit, homogenising and then sieving and collection of a dry 200g - 177µm sample.
		Soils samples were submitted to Labwest (Perth) for Ultra Fine Fraction (UFF) separation (<2µm) and analysis by Aqua Regia ICP-MS & ICP-OES for determination of Au and 45 other elements.
		Stream Sediment Sampling
		Soil samples were collected by Dreadnought and contractor

Criteria	JORC Code explanation	Commentary
		(OZEX Exploration Services) personnel on a ~I sample per 5 sq km drainage catchment across the Project, and infilled to ~I sample per I sq km drainage catchment in areas of interest. Samples were collected by digging multiple pits across active drainage lines in areas with the most fine material and then sieving and collection of a dry 200g -I77µm sample. Stream sediment samples were submitted to Labwest (Perth) for Ultra Fine Fraction (UFF) separation (<2µm) and analysis by Aqua Regia ICP-MS & ICP-OES for determination of Au and 45 other elements.
Drilling techniques	 Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.). 	No drilling reported
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	No drilling reported
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. The total length and percentage of the relevant intersections logged. 	No drilling reported
Sub-sampling techniques and sample preparation	 If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	Rock Chips Entire rock chips were submitted to the lab for sample prep and analysis. No drilling reported
Quality of assay data and laboratory tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	Rock Chips Assay technique is Fire Assay which is a 'Total Technique' for Au. Four acid digest is considered a 'near total' technique for the 48 elements received under ME-MS61. Lithium borate fusion is considered a "total technique" for tungsten. Standard laboratory QAQC is undertaken and monitored by the laboratory and by the company upon assay result receival. No QAQC was reported for Catalyst and Nina Rock chips. Stream Sediment and Soil Samples Samples were screened in the field to -177µm. Labwest then takes a sub-sample of <2µm material for analysis. The UFF sample preparation was defined following a Research and Development project conducted under the direction of CSIRO. Field duplicates are submitted and perform to internal DRE standards. Orientation work as part of CSIRO research and previous work by Dreadnought Resources indicates the grain size is appropriate for the material being tested.

Criteria	JORC Code explanation	Commentary
Verification of	The verification of significant intersections by either	Rock Chips
sampling and assaying	independent or alternative company personnel.The use of twinned holes.	All significant results are revisited with follow up sampling and mapping.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	No prospects on E09/2947 have been visited by Dreadnought, these will be prioritised in the next field program.
	Discuss any adjustment to assay data.	Geochemical sample coordinates and geological information is written in field books and coordinates and track data saved from handheld GPSs used in the field.
		Field data is entered into excel spreadsheets and then loaded into a geological database.
		Soil Samples
		All significant results are revisited with follow up sampling (upstream) including occasionally a repeat sample from the original location.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Geochemical sample coordinates and geological information is written in field books and coordinates and track data saved from handheld GPSs used in the field.
	 Specification of the grid system used. Quality and adequacy of topographic control. 	Field data is entered into excel spreadsheets and then loaded into a geological database.
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	The soil and stream sediment sample spacing and distribution is not sufficient to establish the degree of geological and grade continuity appropriate for a Mineral Resource.
Orientation of data in relation to geological structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	At this early stage of exploration, mineralisation thickness's, orientation and dips are not known.
Sample security	The measures taken to ensure sample security.	No sample security information is known for the Catalyst and Nina rock chips samples.
		All geochemical samples were collected, bagged, and sealed by Dreadnought or OZEX staff.
		Samples were delivered to Labwest (Perth) by Dreadnought or its freight contractors.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	The program is continuously reviewed by senior company personnel.

Section 2 Reporting of Exploration Results (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	The Mangaroon Project consists of 22 granted Exploration License (E08/3178, E08/3229, E08/3274, E08/3275, E08/3439, E09/2195, E09/2290, E09/2359, E09/2370, E09/2384, E09/2405, E09/2422, E09/2433, E09/2448, E09/2449, E09/2450, E09/2467, E09/2473, E09/2478, E09/2479, E09/2535, E09/2616), I pending Exploration License (E08/3539) and 6 granted Mining Licenses (M09/63, M09/91, M09/146, M09/147, M09/174, M09/175). All tenements are I00% owned by Dreadnought Resources. E08/3178, E09/2370, E09/2384 and E09/2433 are subject to a 2% Gross Revenue Royalty held by Beau Resources. E08/3274, E08/3275, E09/2433, E09/2448, E09/2449, E09/2450 are subject to a 1% Gross Revenue Royalty held by Beau Resources. E09/2359 is subject to a 1% Gross Revenue Royalty held by Prager Pty Ltd. E09/2422, E08/*3229 and E08/3539 are subject to a 1%

Criteria	JORC Code explanation	Gross Revenue Royalty held by Redscope Enterprises Pty Ltd. E09/2290, M09/146 and M09/147 are subject to a 1% Gross Revenue Royalty held by STEHN, Anthony Paterson and BROWN, Michael John Barry. E09/2497 is subject to a 1% net smelter royalty held by Nina Minerals Pty Ltd. M09/174 is subject to a 0.5% Gross Revenue Royalty held by STEHN, Anthony Paterson. M09/175 is subject to a 0.5% Gross Revenue Royalty held by STEHN, Anthony Paterson and BROWN, Michael John Barry. M09/91 is subject to a 1% Gross Royalty held by DOREY, Robert Lionel. M09/63 and E09/2195 are subject to a 1% Net Smelter Royalry held by James Arthur Millar The Mangaroon Project covers 4 Native Title Determinations including the Budina (WAD131/2004), Thudgari (WAD6212/1998), Gnulli (WAD22/2019) and the Combined Thiin-Mah, Warriyangka, Tharrkari and Jiwarli (WAD464/2016). The Mangaroon Project is located over Lyndon, Mangaroon,
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Gifford Creek, Maroonah, Minnie Creek, Edmund, Williambury and Towera Stations. Historical exploration of a sufficiently high standard was carried out by a few parties which have been outlined and
,	paraes.	detailed in this ASX announcement including: Regional Resources 1986-1988s: WAMEX Reports A23715, 23713 Peter Cullen 1986: WAMEX Report A36494 Carpentaria Exploration Company 1980: WAMEX Report A9332 Newmont 1991: WAMEX Report A32886 Hallmark Gold 1996: WAMEX Report A49576 Rodney Drage 2011: WAMEX Report A94155 Sandfire Resources 2005-2012: WAMEX Report 94826 Helix Resources 1996: WAMEX Report 49943 Catalyst Metals 2005-2012: WAMEX Report 102554, 97998, 93865, 90360, 87449, 93011, 81706, 81597, 79470, 75940, 72830
Geology	Deposit type, geological setting and style of mineralisation.	The Mangaroon Project is located within Mangaroon Zone of the Gascoyne Province. The Mangaroon Project is prospective for orogenic gold, magnatic Ni-Cu-Co-PGE mineralisation and carbonatite
Drill hole information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	hosted REEs. No drilling reported
Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be 	No drilling reported

Criteria	JORC Code explanation	Commentary
	shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known'). 	
Diagrams	 Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	suitable cautionary note.
		Minimum: <0.5 ppb Max: 31.5 ppb
		Median: 1.8 ppb Mean: 2.2 ppb
		Std Dev: 2.0 ppb 90%: 3.8 ppb
		95%: 4.8 ppb 98%: 6.7 ppb
		Statistics for UFF soil samples (Au) within the Mangaroon Project to date (n: 9,763) are:
		Minimum: <0.5 ppb Max: 970.5 ppb
		Median: 3.0 ppb Mean: 5.3 ppb
		Std Dev: 14.9 ppb 90%: 9.6 ppb
		95%: 14.4 ppb 98%: 24.1 ppb
Other substantive exploration data	 Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	within the text of this document.
Further work	 The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	Additional soil sampling Heritage and environmental surveys RC drilling
